Installing and using IRI Temple plugin for Excel:

The Temple plugin is provided by IRI in a protected environment, so you cannot keep the macros used by the plugin. The plugin is installed in a virtual machine (VM) version of Excel, which you have to log in to access.

There are two ways to access the Temple plugin: via a 'client' application which you install on your computer, or via a browser. They both use the same version of Excel, and have the same functionality with the Temple plugin and access to the same data. The difference is what else you have access to.

Using the Client (the application), you should be able to access your local hard drive (but not flash drives); your 'H: drive', which is a networked drive hosted by Massey; and possibly your OneDrive hosted by Massey/Microsoft. Thus you can save your work on your local machine, and open previously saved work (such as partially completed labs). You should also be able to copy data between the VM and your own version of Excel, using copy and paste.

Using the browser, you cannot access your local hard drive or OneDrive, and cannot copy and paste. Thus while you can generate the data we need for Labs 9 and 11, you cannot capture and save it, which is a pretty big limitation!

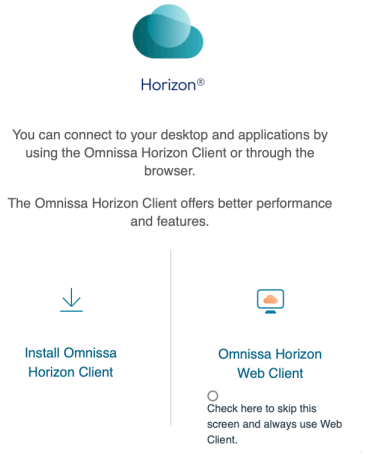

The best option is to install and use the Client. If this doesn't work for you, then use the browser version (see section 3 below), and try shifting your work to somewhere you can save it (but most likely, you won't be able to). See section 3.4 of this document for suggestions on what to do in that case.

1) Installing VMWare Horizon Client

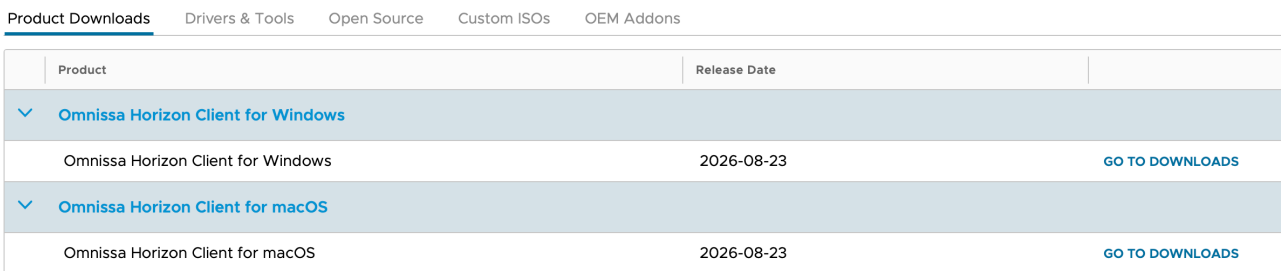

This requires installer privileges (Administrator access).
{If you do not have this, or choose not to install the client, skip down to Section 3 below.}

1.1) In a browser such as Safari or Chrome, type https://remote.massey.ac.nz/

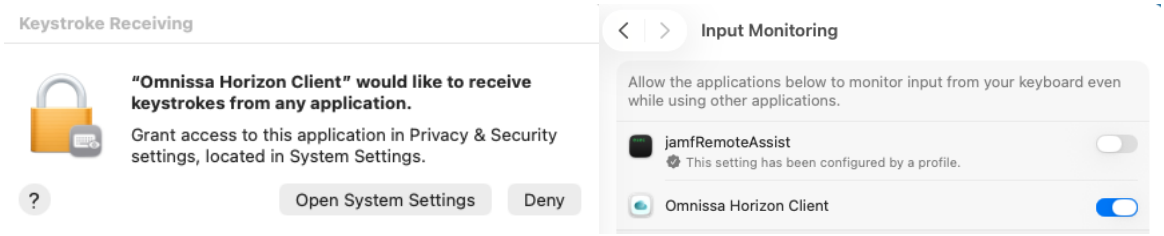

Select "Install Omnissa Horizon Client".

1.2) Choose the installer for your operating system, and follow all the steps for installation. You need administrative access on your computer for this to proceed. Once installed you will likely be asked to update the software, which you should do. Allow receiving keystrokes, if prompted.

You may need to restart your machine once installed.

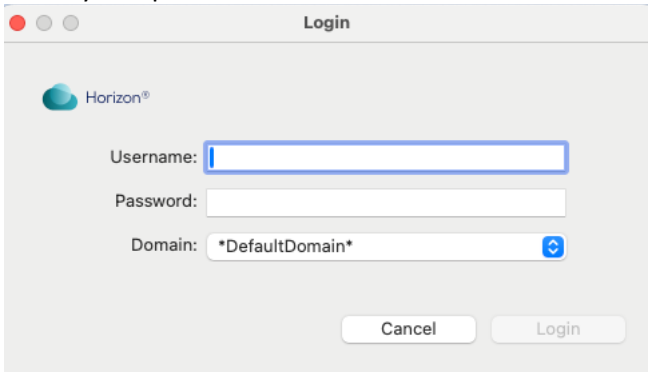

(Eg for Mac OS [Tahoe])

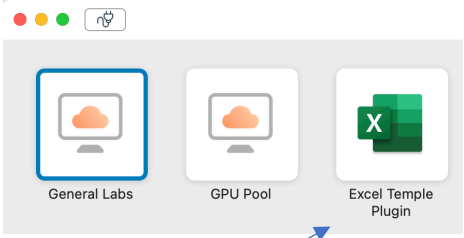

You only need to install the Client once.

1.3) Launch Omnissa Horizon Client. Click on the "remote.massey.ac.nz" button (if shows), otherwise click on the + button and add a New Server using remote.massey.ac.nz as the address.
For future sessions you do not need to add a New Server: you should see remote.massey.ac.nz as a clickable option.

1.4) Log in using your regular Massey details. (The login screen is exactly the same as you would see in Massey computer laboratories – leave Domain as the *DefaultDomain*).

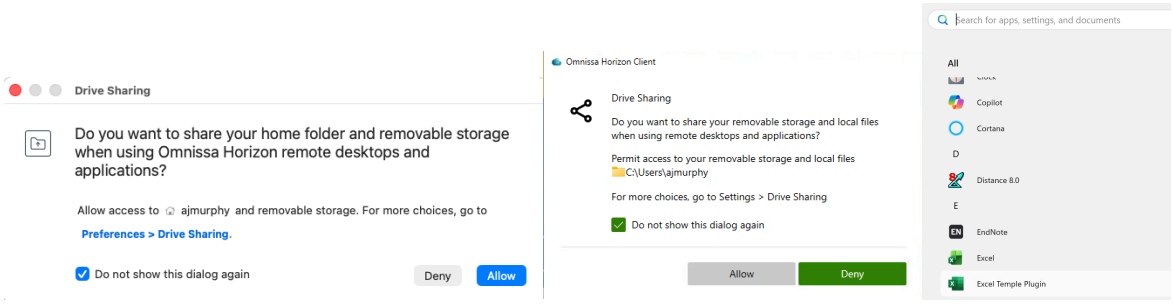

1.5) You should see buttons labelled "General Labs" and "Excel Temple Plugin" (and perhaps some others).
Using the Client, both "General Labs" and "Excel Temple Plugin" give you access to your H: drive (the documents folder on a Massey computer) and your Massey-provided OneDrive folder. You may also be able to access your local hard drive folders (eg via This PC > Documents), and you should be able to copy the data from any tables you generate via the plugin to another application and file, such as the Lab file running in your locally-installed Excel program.

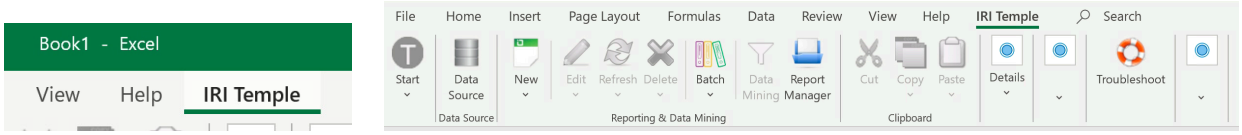

Please note: ITS have on occasion experienced some technical difficulties getting the plugin to load properly via the General Labs route. I suggest you use the Excel Temple Plugin route.

If you get a message like this, click Allow (you may get it twice: once for your own computer, and again in the virtual machine environment):

Please note this creates a "virtual machine" (VM), running Windows, no matter which platform you launch it from (Windows, Mac, iOS…). If you are running it from Windows, you will now have TWO Windows systems: the native one on your computer, and the VM. Within the VM will you have access to your H drive, Massey's OneDrive etc (plus other software on the Massey lab computers, potentially including SPSS).

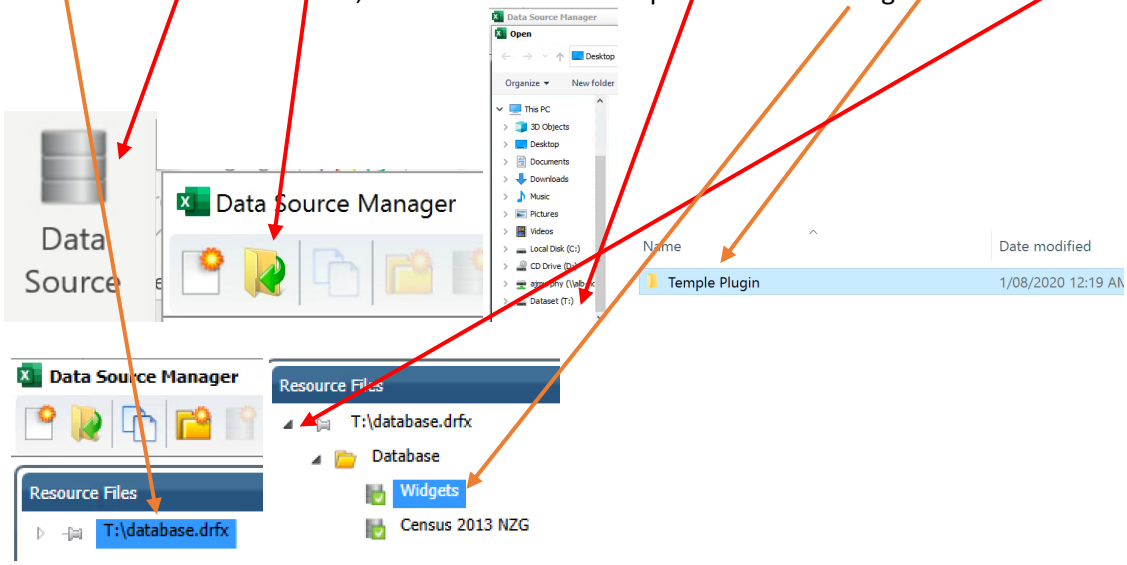

1.6) Once the Excel Temple Plugin version of Excel is running, start a Blank worksheet. You will see a menu item called IRI Temple, which brings up its own ribbon:

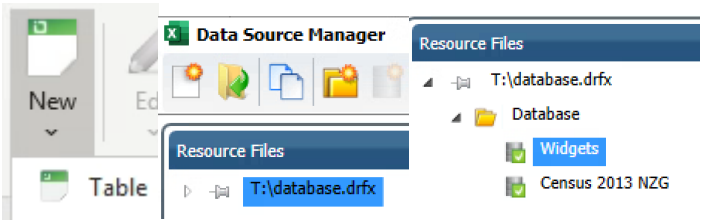

2) Using Omnissa Horizon Client

The following instructions will need to be followed each time to use the plugin to get access to the data, to generate summary tables.

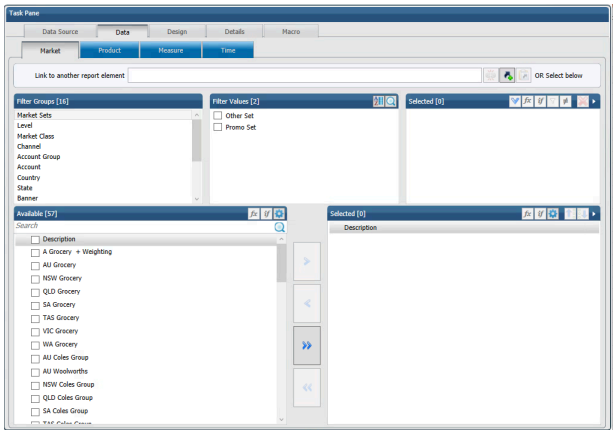

2.1) The first step is to get access to the data, which requires opening the file database.drfx
Click on Data Source > Open > open This PC to reveal Data (T:), and open Temple Plugin, and open the file database.drfx and then Save and OK. If this process works as it should, you should see a triangle to the left of the database.drfx filename, and should be able to open it to select Widgets. Double-click this to Save.

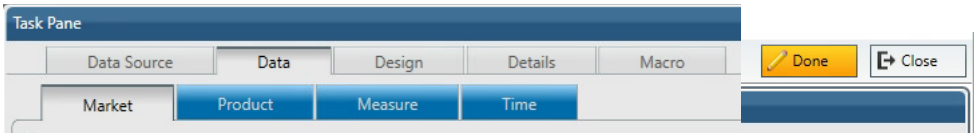

2.2) Now to use the plugin! In the blank sheet, click in cell B2. (It doesn't really matter where you click, but that cell is *where the new table will be placed. It helps to have space to the left and above where the table goes.)* Click New (if you click the down arrow, choose Table – but easier if you click on the picture above). [If you didn't already do this above, you will need to open the database.drfx > Database > Widgets (but you don't need to do this again).]

2.4) This brings up a complicated dialog box with many different options:

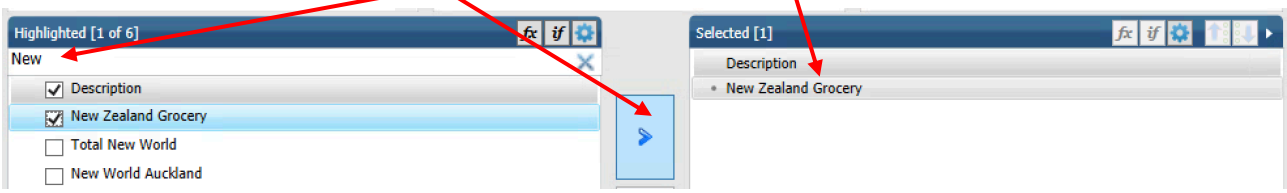

2.3) The key ones are: Market; Product; Measure; Time. Once you have selected something for each of these (at least one Market, Product, Measure and Time selected), click Done to create the table.

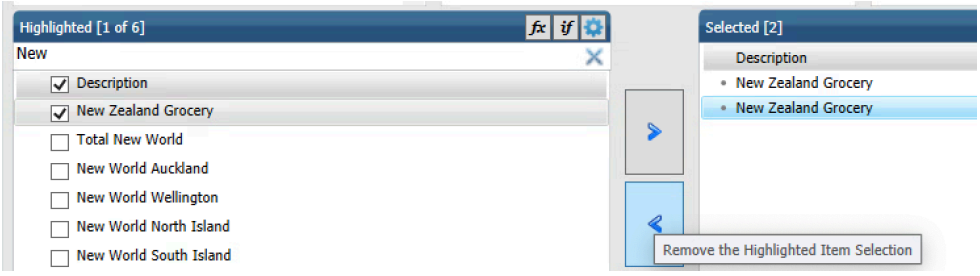

Market refers to stores, regions, brands or all of NZ (there are 57 different geographies across Australia and NZ you could select, but we will use New Zealand Grocery as a whole for Labs 3 and 9).

2.4) *Product* could be one of 162 individual products (eg Fab Protein Not So Yummy Clusters 620g), or Manufacturer ('Best, 'Better'). For Lab 9 we use all 162 products, even though many of them have no data (ie, show 0 values); for Lab 11 we select two products:
Measure includes dollars, units, discounts etc (there are 308 options to choose between)
Time could be any of the 520 weeks available from 08/05/16 to 19/04/26, or aggregations to 4-week summaries, calendar months, quarters, calendar years, or moving annual totals (a 12 month period up until the most recent week available, which in this training dataset is MAT to 19/04/26)

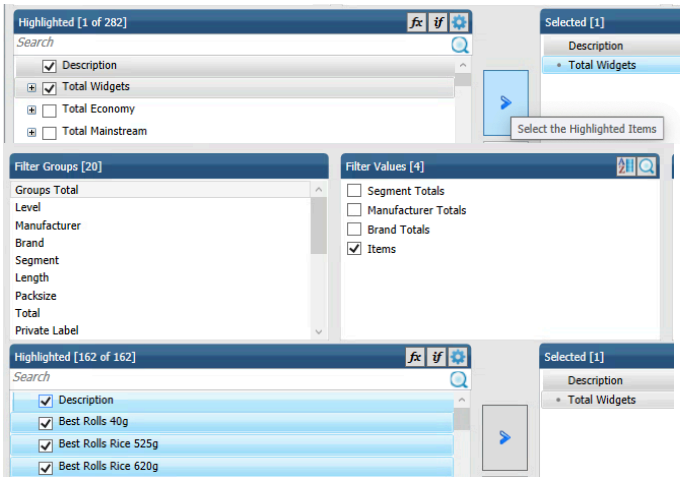

2.5) In *Market*, select NZ Grocery (scroll down or search for it in the Search box, click that option in the bottom-left box, and click the move button to put it into the Selected box

If you end up with a selected entry twice, click on the duplicate and click on the Remove button

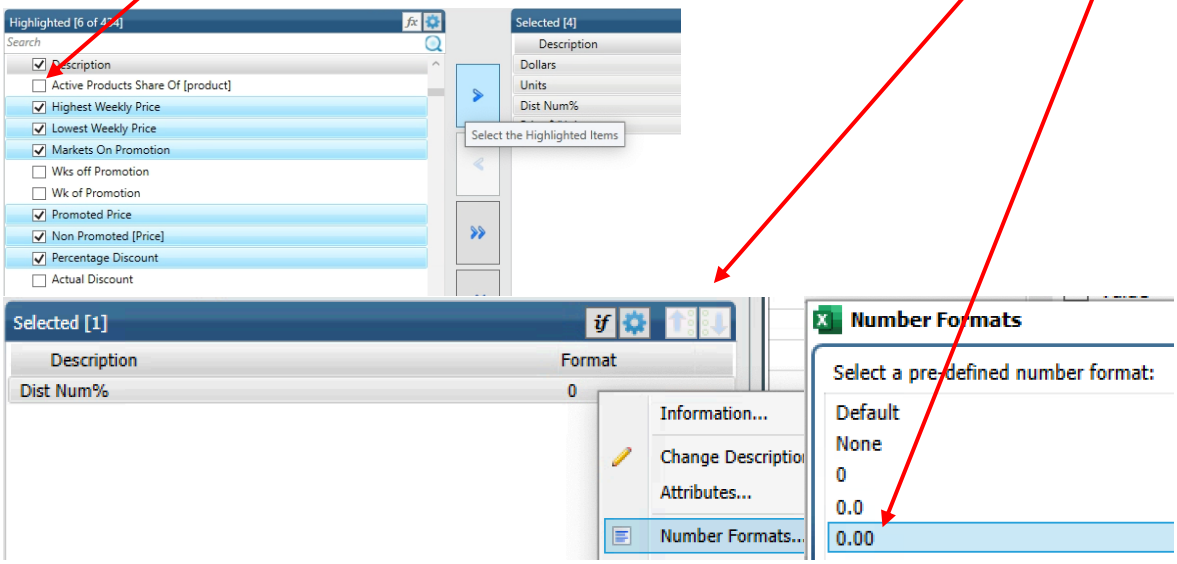

2.5) Click on the *Product* tab, and highlight Total Widgets (if needed – yes in Lab 3, no in Labs 9 and 11), and move it across; then deselect Total Widgets in the 'Highlighted' box (otherwise you will enter it twice). Click on the Items filter Values, and click on the 'select all' box to the left of Description to highlight the whole list of products to the end. Move all 282 products across to the Selected box.

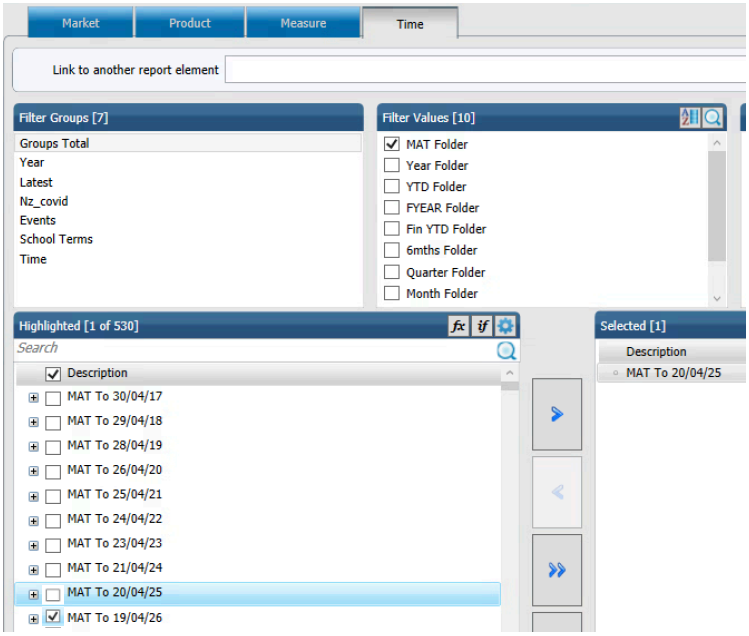

2.6) The *Measures* tab is the most complex. For Lab 9 I suggest you select *Dollars; Units; Dist Num%; Price $/Unit* then shift those across and deselect them all by clicking the Description box below Highlighted (click twice to deselect all); then scroll down to (or Search for) *Highest Weekly Price; Lowest Weekly Price; Promoted Price (>= 3 % 9 wks); Non Promoted [Price], Percentage Discount (>= 3 % 9 wks);* and move these across, and deselect after moving.

If your measures end up in the wrong order, you can select the one you want to move and use the up/down arrows.

Also note the Format: right-click on the 0 alongside DistNum%, and change the number of decimal places to 2

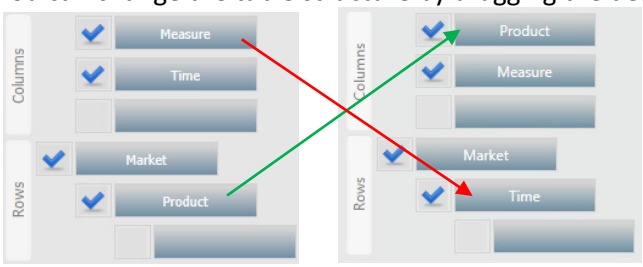

2.7) The *Time* tab is easy: select MAT to 19/04/26.

2.8) Click Done to create the table in Excel. This should be set up the same way as IRI SKUs in Lab 9 if you've done it right!
If not, click Edit in the Ribbon to bring up the Task Pane, and the Data tab to revise what is selected.

2.9) The Design tab allows you to shift around how the table is set up. The default is Time and Measure in columns, and Market and Product in Rows (we have only selected one Time and one Market, so it is effectively Measures in columns and Products in rows).
For Lab 11 this will be set up differently, with Time in the rows and Products in columns.
You can change the table structure by dragging the desired item to where you want it to be

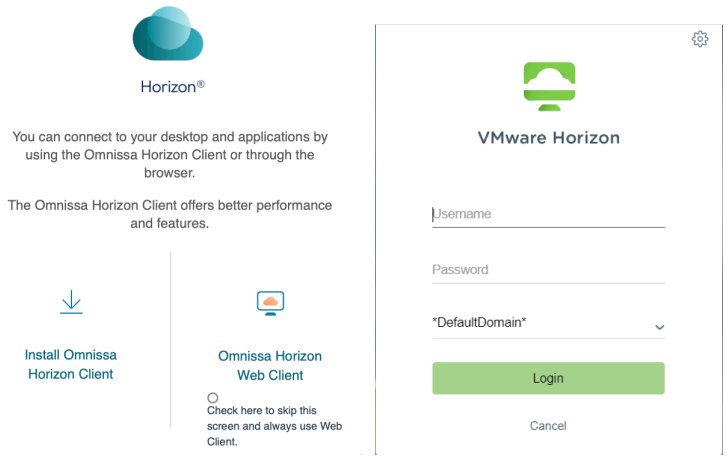

Have a play and choose different time periods, markets and measures. Create a new table in a new sheet, or select a different starting place in the same sheet.

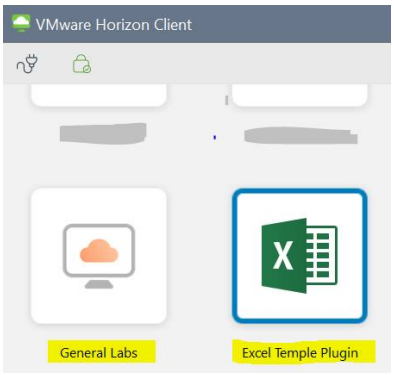

3) Using the browser version of Omnissa Horizon Client

The Excel Temple Plugin works exactly the same in the Client and via the Browser, so Section 2 above applies to either method. Accessing the plugin works a little different.

3.1) Select VMWare Horizon HTML Access and login

3.2) You should see buttons labelled “General Labs” and “Excel Temple Plugin” (and perhaps some others). Using the Browser, both “General Labs” and “Excel Temple Plugin” should give you access to your H: drive (the documents folder on a Massey computer), and the OneDrive folder provided by Massey University; it likely won’t show any other OneDrive folder you have access to, or any folders on your local machine (potentially including flash drives).

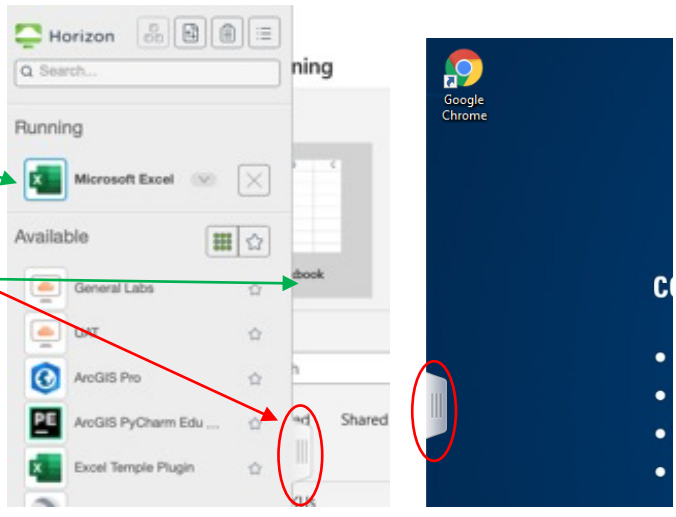

You might not be able to copy data from the tables you generate using the plugin to anywhere else. This means you will have to upload the data you generate using this method to a temporary submission box (see Topic 9 and 11).

3.3) Clicking on the Excel Temple Plugin will load a VM version of Excel with the Temple Plugin installed. Follow Section 2 instructions above to activate the IRI data and extract data.

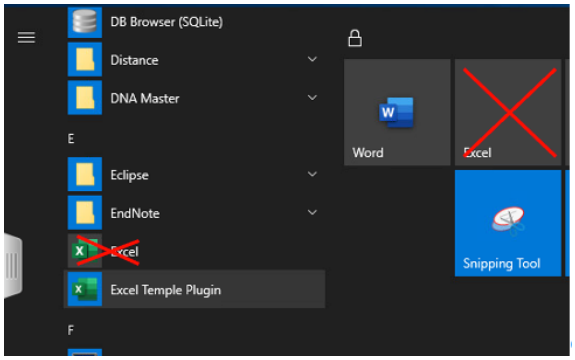

3.4) When you’ve completed the required task, you still have the problem of getting the data into the Lab file. If you can write to a flash drive or a local folder, that is the easiest.
If not, you can use the browser available within the VM to open the course Stream site, and upload your file to “IRI Data temporary submission box (NOT MARKED)” as a draft. Then using your usual browser, download that file to copy the data across to your actual Lab file.
A simpler option is to install and use the Client (Section 1 above) if you are able to,.

3.5) How do you find the VM browser? When you first start the Excel Temple Plugin, you might see this sidebar, which shows that Excel is running. You hide it by clicking the tab marker at the side of the sidebar. That allows you to click on the Blank workbook icon which lies beneath the sidebar.
To find the VM browser, click the hidden sidebar tab marker again and click on General Labs. You may see a temporary grey screen of death, but then a Windows window will open, and you should see Google Chrome. Click the

sidebar tab marker again to reveal Excel, and you can switch between Chrome and Excel this way.

3.6) If instead of choosing the Excel Temple Plugin button you started with the General Labs button, you will need to open Excel using the Windows Start Menu. DO NOT use the Excel button on the right-hand side: that will not load the Temple plugin. Instead scroll down the Windows start menu to the Es, to find Excel Temple Plugin.
.

3.7) When you have finished using the Virtual Machine, you should log out, so the VM can be closed and destroyed (on Massey's servers). This will happen automatically after some time if you just close the browser window (or quit the client), but this does not happen straight away – and if you want to log back in again, there is a possibility you won't be able to until this process is finished. Logging out forces that closure-and-destruction process to occur within seconds.
